PERIPHERAL BLOOD SMEAR

Primary Sample Type: EDTA Blood

Peripheral Smear

PERIPHERAL BLOOD SMEAR (PBS)

RBCS:-

Rbcs show mild degree of microcytosis and hypochromia. Anemia

WBCS:

Leucocytes show no abnormalities

No significant band cell / toxic granules seen

THROMBOCYTES:

Platelets appear to be decreased in number and are normal in morphology.

No hemoparasite seen.

No immature cell seen.

IMP:- Microcytic hypochromic Anemia (Mild) with thrombocytopenia.

PATIENT'S NAME: ROHIT KUMAR CANKID	AGE/SEX: 3/Male
REF. BY: DR. AIIMS	REG./UID: RMD7640
PATIENT'S REF: (None)	EXAM. DATE: 29-JUL-2026

CONTRAST MRI HEAD ORBITS

STUDY PROTOCOLS:

MR IMAGING OF THE BRAIN WAS PERFORMED USING FLAIR, T1 AND T2 WEIGHTED AXIAL SECTIONS, AND CORRELATED WITH T2W SAGITTAL AND FLAIR CORONAL IMAGES. IMAGING OF ORBITAL REGIONS WAS PERFORMED USING CORONAL STIR, T1W AND T2W SECTIONS AND CORRELATED WITH T1W AND T2W AXIAL AND SAGITTAL IMAGES. POST CONTRAST SE T1 WEIGHTED IMAGES WERE ALSO OBTAINED IN CORONAL, SAGITTAL AND AXIAL PLANES. POST CONTRAST SE T1 WEIGHTED IMAGES WERE ALSO OBTAINED IN CORONAL, SAGITTAL AND AXIAL PLANES.

FINDINGS:

The cerebral parenchyma appears normal in signal intensity with maintained grey and white matter differentiation. No focal parenchymal lesion or signal alteration is apparent at present.

Diffusion weighted imaging carried out does not reveal any area revealing hyperintense signal intensity with increasing 'b' values.

Both cerebellar hemisphere and brainstem appear normal in morphology and signal intensity. Cerebellopontine angle regions appear normal.

Basal ganglia and thalamic regions appear normal in morphology.

Ventricles are normal in shape, size and outline. Septum is in midline. Basal cisterns and sylvian fissures are normal.

Sellar and parasellar regions appear normal.

Left eye ball is shrunken in size and shows well defined intra ocular altered signal intensity heterogeneously enhancing altered signal intensity lesion measuring approx. 37 x 25 mm in the left eye ball infiltrating into the extraocular region in the intraconal space posteriorly indenting and optic nerve to the right side.

Left globe and extra ocular muscles appear normal. Retro-ocular space and fat planes are preserved.

Bilateral optic nerves grossly appear normal.

Optic chiasma appears normal in contours and signal intensity, at present.

Bilateral cavernous sinuses appear normal.

IMPRESSION: CEMR imaging of brain and orbits reveals :

- **Shrunken left eye ball with well defined intra ocular altered signal intensity heterogeneously enhancing altered signal intensity lesion in the left eye ball infiltrating into the extraocular region in the intraconal space posteriorly indenting and optic nerve to the right side – suggestive of retinoblastoma.**

Please correlate clinically
